EventOps Intelligence

Repository review - 11 October 2026

Purpose

A React workspace for structured retrieval-augmented generation and bounded event-verification workflows.

Architecture

React/Vite and React Flow connect to FastAPI and PostgreSQL/pgvector. FastEmbed supports semantic retrieval; optional Gemini answers retain citations and context.

Verification workflow

LangGraph coordinates calendar, email and web reads, then extraction, normalization, deduplication and verification. Runs, results and provenance persist for review and CSV export.

Implementation status

Calendar and web record processing have live evidence. Mailtrap connectivity is confirmed, but email record processing remains unverified. Real n8n automation and CSV/JSON uploads are future increments. The repository reports no public deployment.

Controls

Demo-session isolation, explicit CORS, persistent quotas and bounded read-only tools constrain public assessment access.
